Challenges

We encountered some challenges while working on the training page. Drew had issues with having the user go on to the next lesson or retrying the current lesson. He solved this by communicating with Ben, who was working with him on the training section, and they were able to get it solved.

Another challenge we encountered was using ejs vs html, as initially Tianwei made a neat html layout for every page but css and js was used. This meant that the page could not be rendered using node.js and instead we had to use a express's .sendfile() which sends static files to the client. Alex worked around this by only making the necessary pages .ejs such as the account, login and registration pages. All which had a different design than that of Tianwei's.
